

HOW DOES EASYCONNECT WORK?

easyconnect is a Closed Transfer System (CTS) that makes filling your sprayer faster, easier and safer than conventional methods.

easyconnect is supported by a large number of crop protection manufacturers, so you can enjoy the benefits across a wide range of products.

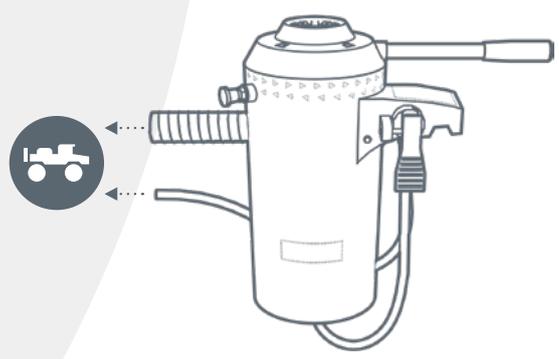

1 CAP

The easyconnect cap is resealable and leak-proof. The connecting plug safely contains the remaining product until the next usage.

The dust cover provides additional protection to keep the connecting plug free of dust and debris.

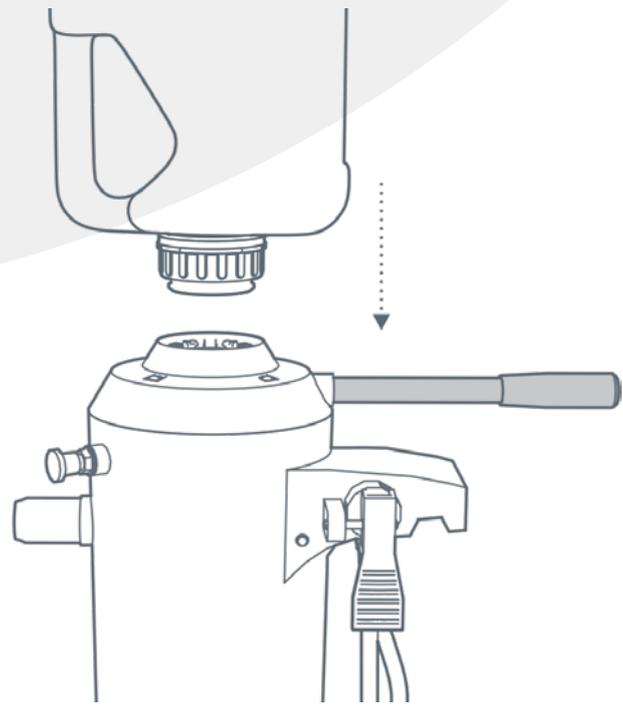

2 COUPLER

The coupler connects to a sprayer tank to transfer the product into the sprayer.

The coupler only requires a one-time installation by a technician and is then ready to use.

3 CLOSED TRANSFER SYSTEM

A container with an easyconnect cap is connected to the coupler.

Used together, the easyconnect cap and coupler are a safer and more efficient way to easily empty a wide range of container shapes and sizes than conventional filling methods.

easyconnect CTS works without adapter or foil seal.

The unique cap is designed to fit all containers with IS 63 industry standards, irrespective of container size and manufacturer.

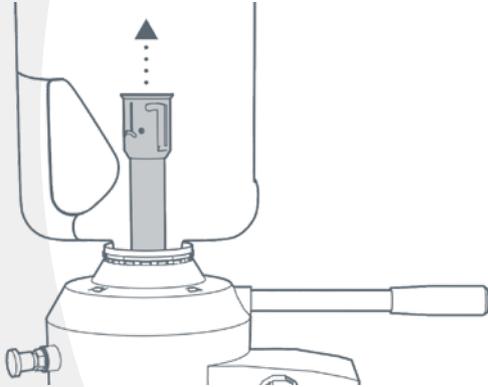

The easyconnect cap, pre-fitted on the container, allows the container to be connected directly and cleanly to the coupler and establish a true 'closed system'.

The easyconnect cap can also be unscrewed manually for use with a traditional filling method if a coupler is not available.

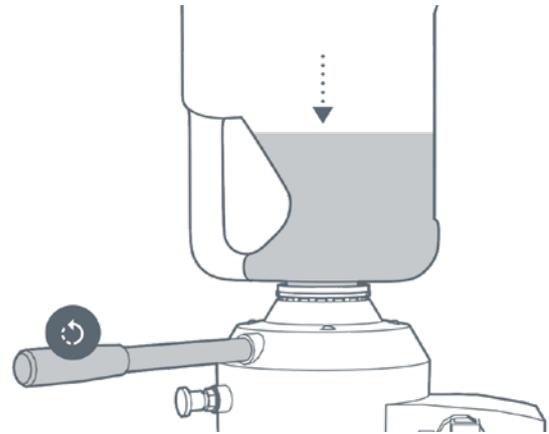

HOW DOES EASYCONNECT WORK?

4 EMPTYING

To empty the container, the coupler probe pushes the internal connecting plug of the easyconnect cap into the container, thereby allowing the liquid contents to be emptied via the coupler into the tank.

The easyconnect system enables complete or partial removal of the product as the coupler automatically re-closes the container prior to disconnection.

Part pack emptying:

Specific product volumes can be dispensed by moving the operating handle back and forth to control the emptying speed.

Measuring of the volume is possible by using the scale on the container or the scale on the translucent suction hose.

The easyconnect cap is resealable and leakproof and safely contains any remaining product for the next use.

5 CLEANING

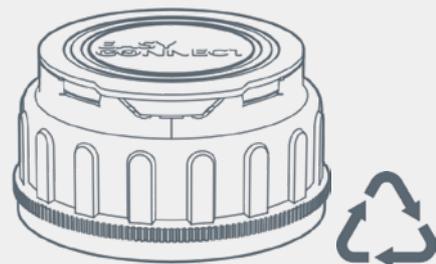

The easyconnect system includes an integrated rinsing system.

For complete emptying, it cleans the empty container, cap and connecting plug to make it ready for recycling.

For partial pack emptying, the system cleans the suction hose and the connecting plug.

6 MATERIALS

The easyconnect cap is made of HDPE and can be recycled according to local regulations.

The drawings, descriptions and technical information contained herein are believed to be accurate, but are, however, of exemplary nature. Since easyconnect CTS is a technical novelty, features and outer appearance of the easyconnect cap, the coupler or canister may change. The easyconnect CTS is designed for use solely with liquid plant protection products filled in canisters pre-equipped with the easyconnect cap. Other uses are not approved and may result in damage to equipment, property or personal injury. Before working with the easyconnect CTS, carefully read and understand any instructions. For information on training material, please consult your local retailer or visit the website easyconnect.tech. When processing plant protection products – even with the easyconnect CTS – always wear required and appropriate personal protective equipment and ensure compliance with all applicable local laws and regulations.

Use plant protection products safely. Always read the label and product information before use.

For more information, please consult your local retailer or visit the website www.easyconnect.tech.
